I²C BUS DESCRIPTION

Start and stop conditions

A start condition is activated when the SCL is set to HIGH and SDA shifts from HIGH to LOW state. The stop condition is activated when SCL is set to HIGH and SDA shifts from LOW to HIGH state. Please refer to the timing diagram below.

SCL : Serial Clock Line, SDA : Serial Data Line

Data validity

A data on the SDA line is considered valid and stable only when the SCL signal is in HIGH state. The HIGH and LOW states of the SDA line can only change when the SCL signal is LOW. Please refer to the figure below.

Byte format

Every byte transmitted to the SDA line consists of 8 bits. Each byte must be followed by an acknowledge bit. The MSB is transmitted first.

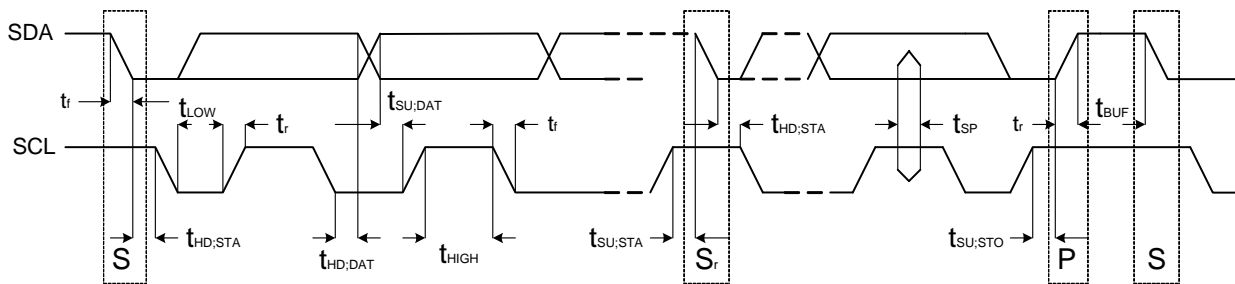

Acknowledge

During the Acknowledge clock pulse, the master (up) put a resistive HIGH level on the SDA line. The peripheral (audio processor) that acknowledges has to pull-down (LOW) the SDA line during the Acknowledge clock pulse so that the SDA line is in a stable LOW state during this clock pulse. Please refer to the diagram below.

The audio processor that has been addressed has to generate an Acknowledge after receiving each byte, otherwise, the SDA line will remain at the HIGH level during the ninth (9th) clock pulse. In this case, the master transmitter can generate the STOP information in order to abort the transfer.

Timing of SDA and SCL bus lines

BUS INTERFACE

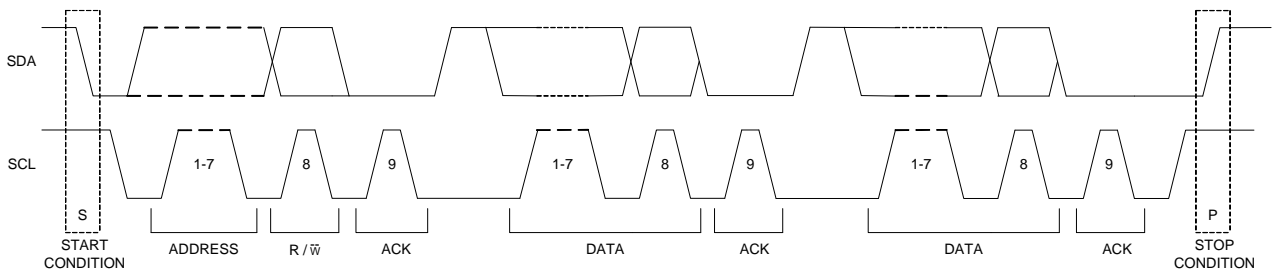

Data are transmitted to and from the MCU to the MS6260 via the SDA and SCL. The SDA and SCL make up the BUS interface. It should be noted that pull-up resistors must be connected to the positive supply voltage.

Interface protocol

The format consists of the following

- A START condition
- A chip address byte including the MS6260 address. (7bits)
- The 8th bit of the byte must be "0".(write=0, read=1)
- The MS6260 must always acknowledge the end of each transmitted byte.
- A data sequence (N-bytes + Acknowledge)
- A STOP condition

Pin1(A.O.) = Low or Open

2. The function of power off preparation is to prevent pop noise when power off.
3. The initial condition is set to be maximum attenuation -79dB and mute on mode when power on.

Example

Mute off

The initial condition is -79dB and mute on when power on. The first command must disable the mute function.

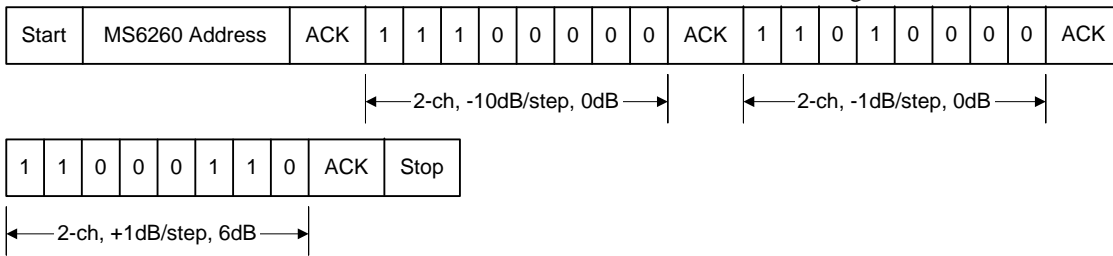

Set gain of 2 channel at 0dB

Set gain of 2 channel at 6dB

The value of attenuation must be set zero when the volume from attenuation to gain.
